

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

1 (original). Polymer of ethylene which has:

a  $\mu_0/\mu_2$  ratio of at least 13; and

a high load melt index HLMI lower than 8 g/10 min, and

a value of  $\tan \delta$  at  $\omega/\omega_c = 0.01$  of less than 1.3, where  $\delta$  is  $G''/G'$ ,  $\omega$  is the frequency at which  $G''$  and  $G'$  are measured and  $\omega_c$  is the frequency at which  $G'' = G'$ , and  $G'$  and  $G''$  are respectively the elastic modulus and viscous modulus, both measured in Pa at 190°C.

2 (original). Polymer according to claim 1, which has a  $\mu_0/\mu_2$  ratio of at least 14.

3 (currently amended). Polymer according to claim 1 or 2, having a density D (measured according to ASTM D 792 standard) of between 930 and 955 kg/m<sup>3</sup>.

4 (currently amended). Polymer according to ~~any preceding claim~~ claim 1, having a Pent test value (determined in accordance with ASTM F 1473-94 standard) higher than 150.

5 (currently amended). Polymer according to ~~any preceding claim~~ claim 1, having a polydispersity index greater than 50.

6 (original). Process for the preparation of a polymer of ethylene which has a  $\mu_0/\mu_2$  ratio of at least 13 and a high load melt index HLMI lower than 8 g/10 min, wherein ethylene, and optionally at least one higher alpha-olefin, are contacted with a catalyst comprising chromium supported on a silica-titania support.

7 (original). Process according to claim 6, which is conducted in the absence of a cocatalyst.

8 (currently amended). Process according to claim 6 or 7, wherein the polymer is as defined ~~above in any one of claims 1-5~~.

9 (currently amended). Process according to ~~any one of claims 6 to 8~~ claim 6, wherein the catalyst contains between 0.8 and 1.5 weight % of chromium and between 1.9 and 3.1 weight % of titanium on the support, based on the weight of the support; and the support has a specific surface area SA (measured in accordance with British Standard BS 4359/1) of between 450 and 550 m<sup>2</sup>/g, a pore volume PV (measured by BET N<sub>2</sub> analysis using desorption isotherm and considering only radii of pores equal to at least 300 Angstroms) of between 1.8 and 2.7 ml/g, and an average pore diameter between 120 and 200 Angstroms.

10 (currently amended). Pipe comprising a polymer of ethylene as defined in, ~~any of claims 1-5~~ claim 1.

11 (currently amended). Use, for the manufacture of pipes by extrusion, of a  
| polymer of ethylene as defined in ~~any of claims 1-5~~claim 1.
